

**Does the Pure 12-String fit into your guitar?**

The Pure 12-String may be too big for some guitar models. K&K recommends the Pure Mini pickups for all 6-string guitars.

**This is an actual size diagram of the Pure 12-String:**

*pin hole side*

*soundhole side*

Please print out this page and double-check the dimensions below:

Total dimensions mm (all 3 pickups):  
22mm (height) x 61mm (length-left to right)

Total dimensions inches (all 3 pickups):  
0.86" (height) x 2.4" (length-left to right)

Please cut out the diagram along the outer edges and along the dotted line in the center (you should end up with ONE connected piece).

Follow these instructions to check the fit in your guitar:

1. Place the guitar on a table.
2. Loosen the strings and put a capo on the 10th fret.
3. Pull out the string pins and pull out the ball ends of the strings.
4. Position the guitar so you can comfortably put your hand into the sound hole and feel the inside structures underneath the bridge with your fingers.
5. Place a turned-on flashlight (good size please not just a key chain light) inside the guitar.
6. Position the flashlight way back in the lower bout of the guitar and let it shine towards the sound hole.
7. Place a small handheld mirror inside the guitar under the bridge. You may have to use something to support the mirror in case there is a brace in the way. Adjust the mirror so you can see the bridge plate when you peer through a pinhole. You have to get one eye **directly** over a pinhole.
8. Hold the cutout on the bridge plate between pinholes and sound hole.
9. Allow for about an extra 1/8" (3mm) distance between pinholes and the bridge plate edge for the ballends. A little less than 1/8" may be fine, just in case. A ball-end may touch the pickup but it should not "bite" in it.
10. The diagram should fit entirely on the bridge plate, however a small overlap on the sound hole side is acceptable. It should not be more than 3/32" (2mm).
11. If the diagram overlaps more than 2mm or if it does not fit between the X braces at all, please order the 1/2" diameter MINI PURE Pickups. The Mini Pure will sound just as nice and they will fit pretty much any bridge plate. They provide a little less output than the standard size pickups though. The tone quality is the same. Smaller bridge plates are usually more responsive because they have less material. Like this there will be more vibration for the pickups to work with. This almost makes up for the difference in output level.
